# Introduction

DATACOM Smart PDUs (Power Distribution Units) with remote monitoring capabilities play a crucial role in modern data centers by enabling real-time energy monitoring and intelligent power management. These intelligent PDUs provide granular insights into power consumption at the rack level, helping data center operators optimize energy usage, improve efficiency, and enhance capacity planning.

These Smart PDU models empower data centers to improve PUE (Power Usage Effectiveness), streamline capacity planning, and ensure resilient power management in dynamic IT environments.

# Key Features

## Advanced Intelligent Capabilities

The DATACOM Smart PDU series provides administrators with a comprehensive, secure, and reliable power management solution for data centers and server rooms.

01

---

### Remote Management

The smart PDU allows users to remotely manage and control the power supply of each socket through the network. Administrators can monitor and control the power status of devices in real-time from any location with network connectivity, without physically accessing the device location.

02

---

### Electricity Monitoring

Equipped with advanced electricity monitoring functions that track the electricity consumption of each socket in real time. Administrators can view power utilization, power factors, and current load data to assist in energy management and optimization.

03

---

### Environmental Monitoring

Features environmental monitoring capabilities to track temperature and humidity in computer rooms or data centers. This helps administrators promptly identify and resolve potential environmental issues to protect safe device operation.

04

---

### Timed Scheduling

Users can configure scheduled operations to automatically control socket opening and closing times. This feature supports regular equipment maintenance, energy conservation, and coordinated equipment usage timing.

05

---

### Alarm and Notification

Generates real-time alarms and notifications when abnormal situations are detected, such as current overload, temperature abnormalities, or device disconnection. Administrators receive immediate notifications to take timely corrective measures.

06

---

### Security

Designed with multiple security mechanisms including user authentication, access control, and encrypted communication to ensure management permission security and prevent unauthorized access or potential security risks.

# PDU Cascade Configuration

## Scalable Network Architecture

The DATACOM Smart PDU supports advanced cascading capabilities to optimize network infrastructure and reduce costs.

### Cascade Capacity

Up to 99 PDUs can be cascaded together using standard RJ45 patch cords, significantly reducing the need for expensive network ports.

### Master-Slave Architecture

The master PDU's embedded web interface provides centralized control:

- Lists all connected slave PDUs
- Monitors electrical parameters across all units
- Controls individual outlet switching
- Provides unified management dashboard

### Configuration Limitations

While the master PDU can control and monitor slave units, IP address configuration for slave PDUs cannot be changed through the master interface.

### Recommended Setup

For large-scale installations and simplified management, DATACOM recommends deploying central monitoring software with a dedicated server device. This approach provides:

- Streamlined mass installation
- Enhanced management capabilities
- Centralized configuration control
- Comprehensive reporting and analytics

# Controller Panel Components

## Main Interface Elements

The Smart PDU controller panel features an intuitive interface with the following key components:

01

### LCD Liquid Crystal Display Screen

Provides real-time visual feedback on power metrics, system status, and configuration settings.

02

### Navigation Keys

- UP: Page up navigation
- DOWN: Page down navigation
- FUN: Settings and configuration key

03

### Indicator Lights

- Long-distance indicator lights
- Alarm indicator lights for immediate visual alerts

04

### DI Interface

Sensor interface for connecting environmental monitoring sensors.

05

### 485 Interface

485 sensor interface for additional monitoring capabilities.

06

### 485A/485B

485 cascade interface for connecting multiple PDUs in a daisy-chain configuration.

07

### NET Network Interface

Gigabit network port for high-speed network connectivity and remote management.

# Product Overview

## DATACOM Smart PDU Series

DATACOM Smart PDUs come in four distinct series, each designed to meet specific power management and monitoring needs in data center environments:

### **MAG Series - Basic Inline Monitoring**

Provides aggregate power consumption data at the rack level, helping operators track total energy usage.

### **MEO Series - Outlet Monitoring**

Offers detailed, per-device power metrics, enabling precise energy allocation and identifying underutilized or overloaded equipment.

### **MAS Series - Switched PDUs**

Adds remote power control, allowing administrators to power cycle the PDU remotely, delivering real-time power analytics at rack level alongside remote power management.

### **MOS Series - Outlet Monitoring & Switched**

Combines both monitoring and switching features, allowing administrators to power cycle each device remotely. Ideal for optimizing energy use, automating load shedding, and enhancing disaster recovery protocols.

# Contact Information

## DATACOM Support & Sales

For technical support, product inquiries, or sales information, please contact DATACOM through the following channels:

### Email

[info@datacom-networking.com](mailto:info@datacom-networking.com)

### Website

[www.datacom-networking.com](http://www.datacom-networking.com)

### Phone

+971 4 285 8448

### Office Hours

Our team is available to assist you with product selection, technical support, and implementation guidance.
